Subject: Fiber to the premises near term deployment in your area

Verizon will be working in your area to accomplish general network upgrades that involve upgrading portions of our copper facilities with fiber optic cables. These upgrades will enhance the network reliability and improve service quality as well as position Verizon to offer new services in the future.

Verizon will strive to make these upgrades with a minimum of disruption to existing customers,

By overlaying copper cables with fiber, the residents in your area will have a "state of the art" telecommunications network and is another example of Verizon making progress every day to provide customers with the latest technological advancements and the best service available.

Fiber optic cable will:

- Improve network reliability and survivability.
- Improve service quality.
- Offer new high-speed data services to residential and small business customers over fiber using the same packet-switched network technology that we have been using for large business applications.
- Operate at download speeds that are 5 to 10 times faster than the typical DSL service.
- Support other new services in the future.

If your organization would like to schedule a meeting with us to discuss the impact of this project to your neighborhood and to explain the advantages to you, please contact us at 813-664-1088 within 10 days so we can discuss this new initiative further.

Thank you,
